

Technology Statement

Clothing Classification on Fashion-MNIST

Thijs Niekerk (SNR: 2125613)
Pjotr Martens (SNR: XXXXXXXX)

Tilburg School of Economics and Management
Tilburg University

September 14, 2026

This statement accompanies our submission for the Machine Learning Analytics group assignment on Fashion-MNIST classification, in line with the course's and Tilburg University's policy on the use of generative AI and other technology in coursework. *Please adjust the wording below to reflect the specific declaration format required by the course, if one was provided on Canvas, and to match how the two of you actually worked; this is a starting template, not a final statement.*

Software and libraries. All code was written in Python 3, using `numpy`, `matplotlib` and `scikit-learn` (Pedregosa et al., 2011). The Fashion-MNIST data and its loading format follow the description in the dataset's repository (Xiao, Rasul & Vollgraf, 2017).

Use of generative AI. We used Claude (Anthropic), a generative AI assistant, during this project. Specifically, it was used to help draft the data-loading and model-training code in `code/`, to help typeset this report and the accompanying figures in $\text{\LaTeX}$, and to help draft an initial version of the report text based on the results our code produced. Every reported number and figure comes from actually running the submitted code; we reviewed, checked and edited the resulting code, analysis and text ourselves, and we take full responsibility for the correctness and originality of the final submission.

Other sources. Where we relied on external material beyond standard library documentation (for example the published Fashion-MNIST benchmark results used in Part 2e), this is cited in the report's reference list.

We declare that this statement accurately reflects how this submission was produced.
